Title: Smart Outcome Predictor
Duration: 6 Hours

🎯 Objective

The objective of this project is to design a **robust ensemble-based machine learning system** capable of predicting outcomes accurately by combining **multiple weak and strong learners**. Students will explore **bagging, boosting, voting, and stacking strategies**, and understand how ensemble methods improve **generalization, stability, and performance** in both **classification and regression tasks**.

📑 Problem Statement

You are working as a **Machine Learning Engineer** at an EdTech analytics company. The platform wants to build a **Smart Outcome Predictor** that can:

- **Classification Task:** Predict whether a student will *successfully complete* an online course.
- **Regression Task:** Predict the *final performance score* of a student.

Single models are producing unstable results. Your manager asks you to design an **ensemble-based solution** that improves accuracy and robustness by combining multiple models.

🧠 Part A: Conceptual Foundation (Theory)

Answer briefly (2–4 lines each):

1. What are **Ensemble Learning Methods** and why are they effective?
2. Explain the difference between **Bagging, Boosting, and Voting**.
3. What is **Bias–Variance Trade-off**, and how do ensemble methods address it?
4. Explain **Voting Classifier** and **Stacking Ensemble**.
5. Compare **AdaBoost, and XGBoost** conceptually.

🧪 Part B: Dataset Understanding & Preparation

You are provided with a dataset containing:

- Student demographic indicators
- Engagement metrics (time spent, sessions, quiz attempts)
- Assessment scores
- Target variables:
  - `completion_status` → Classification (0 = Not Completed, 1 = Completed)
  - `final_score` → Regression (0–100)

Tasks:

6. Identify features and target variables for both tasks.
7. Perform a **train–test split** for classification and regression problems.
8. Apply basic preprocessing (scaling/encoding if required).

📦 Part C: Bagging (Bootstrap Aggregating)

9. Implement **Bagging Classifier** for course completion prediction.
10. Implement **Bagging Regressor** for final score prediction.
11. Compare bagging results with a single base model.

⚡ Part D: Boosting Algorithms

AdaBoost

12. Implement **AdaBoost Classifier**.
13. Implement **AdaBoost Regressor**.
14. Analyze how weak learners improve sequentially.

XGBoost

15. Implement **XGBoost Classifier**.
16. Implement **XGBoost Regressor**.
17. Compare performance and robustness with other boosting models.

🗳️ Part E: Voting & Stacking Ensembles

18. Implement **Voting Classifier** using multiple base classifiers.
19. Compare **Hard Voting vs Soft Voting**.
20. Implement **Stacking Classifier** with a meta-learner.
21. Implement **Stacking Regressor** for score prediction.

📊 Part F: Model Evaluation & Comparison

22. Evaluate **classification models** using:
    - Accuracy
    - Precision, Recall, F1-Score
    - ROC-AUC
29. Evaluate **regression models** using:
    - MAE, RMSE
    - R^2 Score
30. Compare all ensemble techniques and identify the **best performing model** for each task.

🧾 Part G: Final Analysis & Reporting

31. Prepare a final report covering:
    - Impact of bagging vs boosting
    - Comparison of tree-based boosting algorithms
    - Advantages of voting and stacking
    - Final model recommendation for deployment
32. Submit:
    - Source code / Jupyter Notebook
    - Evaluation tables and plots
    - Working Streamlit app
    - Final conclusions and business interpretation

✅ Submission Guidelines

- Include practical implementation in a Jupyter Notebook and screenshots.
- Label all charts clearly and write short interpretations under each result.
- **GitHub Repository:**
    - Create a GitHub repository to host your project.
    - Upload your project files, including source code and documentation, to the repository along with a live Streamlit app URL.

- Add a document (PDF) explaining theory concepts with definitions (if any).
- Ensure that you provide a clear and descriptive README.md file.

Marking Criteria (10 Marks)

Total Marks: 10 — distributed across 3 components as follows:

Component	Marks	Weight	Deliverable
A. Technical Completion (Jupyter Notebook .ipynb + Streamlit App)	5 Marks	50%	Completed notebook — all tasks, Restart & Run All clean Live working Streamlit App URL
B. Recorded Video Explanation (Face + Screen)	3 Marks	30%	5–10 min MP4/MOV: face + screen, verbal concept explanations
C. GitHub Repository + README.md	2 Marks	20%	Public repo with .ipynb + screenshots + README + video link
TOTAL	**10 Marks**	**100%**	

Component B: Recorded Video — Face + Screen (3 Marks)

Record a video showing your face (webcam picture-in-picture) and your Jupyter Notebook screen simultaneously. Explain concepts verbally throughout — do not just execute cells without speaking.

- **You can use OBS Studio software for recording.**
- **Submit your video link only via a Google Drive sharable link or via a YouTube unlisted link.**

Remember to follow the instructions provided professionally, make suitable assumptions wherever necessary, and avoid copying code or content from unauthorized sources. Good luck with your project work!
